

Glue and Borax Slime

Things you will need:

- PVA Glue
- Water
- Borax Powder
- 2 cups

Instructions:

Fill one of the cups with water and a spoonful of borax powder and mix well. Fill the other cup to about 3cm high with PVA glue. At this point you could add a little food colouring if you wanted. Add about 1tbsp of the borax solution to the glue and stir. As you play with it and stretch it it should begin to make slime. Add more borax solution if needed.

The science behind it:

Slime making is a basic chemical reaction where two substances mix together and their molecules become rearranged. The protein in glue combine with the activator to form a brand new substance.
